Baseball Practice Tracker

Eisenhower Matrix | Anderson Yaen | CS 19300

The Do quadrant is the minimum version: record a session, keep it after restarting, and review practice consistency.

	Urgent	Not urgent
Important	**Do - MVP** 1. Record date, practice type, positive minutes, and optional notes. 2. List sessions and save/load them from a local text file. 3. Show total sessions, minutes by type, and a seven-day summary.	**Schedule - Version 2** 1. Edit or delete existing sessions. 2. Set weekly practice goals and show goal progress. 3. Track performance measures such as hits and at-bats.
Not important	**Delegate - Use libraries** 1. Use LocalDate for date validation and calendar calculations. 2. Use buffered file I/O for reading and writing records. 3. Use Java collection sorting to order sessions by date.	**Delete - Cut from scope** 1. Live MLB scores and sports API integration. 2. Social feeds, public profiles, and team messaging. 3. AI coaching and automated video analysis.

Delegate items are supporting implementation tasks handled by standard libraries. No teammates are required. Progress summaries describe practice time and consistency, not proof of improved baseball performance.
